

LOTUS APPAREL (PVT) LTD

Occupational Health and Safety Manual

Document No	Revision	Effective Date	Document Owner	Approved By
LA-HS-001	04	01/02/2026	Dilhani Rodrigo (Compliance Manager)	Chandana Liyanage (Factory Manager)

1. Purpose and scope

This manual sets out how Lotus Apparel (Pvt) Ltd protects the health and safety of every person working at its premises at No. 42, Zone Access Road, Biyagama Export Processing Zone, Walgama, Malwana. It applies to all permanent, temporary and contract workers, visitors and service providers, across all production floors, stores, the boiler house and the canteen.

2. Responsibilities

The Factory Manager holds overall responsibility for occupational health and safety. The Compliance Manager maintains this manual, keeps safety records and reports monthly to the management team. Line supervisors are responsible for the day-to-day safety of the workers in their lines, including the headcount during an evacuation.

3. Fire evacuation procedure

3.1 Raising the alarm

Any person discovering a fire shall immediately operate the nearest manual call point and inform the security control room on extension 100. The fire alarm is a continuous electronic siren audible in all buildings. Sewing machines and irons shall be switched off at the line isolator before leaving, where it is safe to do so.

3.2 Evacuation

1. On hearing the alarm, all workers leave by the nearest marked exit, walking in single file without running and without stopping to collect personal belongings.
2. Trained floor wardens, at a ratio of one warden for every 25 workers, guide their sections to the exits and check toilets, stores and fitting rooms before leaving.
3. Workers proceed to the designated assembly points: **Assembly Point A** (main car park) for Building A and **Assembly Point B** (staff sports ground) for Building B.
4. Line supervisors complete a headcount against the daily attendance sheet and report any missing person to the Chief Fire Warden within five minutes of arrival.
5. No person re-enters a building until the Chief Fire Warden declares it safe.

The target is for all buildings to be fully evacuated within **three minutes** of the alarm. Workers with reduced mobility and pregnant workers are assigned a named buddy who assists them during evacuation.

4. Fire drills

A full-site fire drill is conducted **once every quarter**, at least one of which each year is unannounced. Drills alternate between day and night shifts so that every worker takes part at least twice a year. The Compliance Manager records the date, time, number of persons evacuated, evacuation time and any problems observed, and corrective actions are tracked to closure.

Most recent drill	Shift	Persons evacuated	Evacuation time	Observation
14/08/2026	Day (unannounced)	612	2 min 48 s	Exit 4 partially blocked by cartons; cleared and re-briefed stores team.

5. Fire fighting equipment

Fire extinguishers are inspected monthly by the maintenance team and serviced annually by a registered agent; each unit carries an inspection tag. The hydrant system and fire pump are test-run weekly. At least 20% of the workforce on each shift is trained in the use of extinguishers, with refresher training every year.

6. Health and Safety Committee

The factory maintains a joint Health and Safety Committee of **twelve members**: six worker representatives elected by secret ballot every two years and six management representatives. The committee is chaired by the Factory Manager, and the Compliance Manager acts as secretary.

- The committee **meets monthly, on the first Wednesday of each month**. Extraordinary meetings are called within 48 hours after any serious accident or dangerous occurrence.
- A quorum is seven members, of whom at least three must be worker representatives.
- The committee reviews accident and near-miss reports, inspection findings, drill results and the status of open corrective actions, and carries out a walk-through inspection of one production area each month.
- Minutes are displayed on all notice boards in English, Sinhala and Tamil within five working days.

7. First aid and medical care

A first aid box is maintained on every production floor, with at least one certified first aider for every 50 workers on each shift. A nurse is on duty in the medical room during all working hours, and a visiting doctor attends twice a week.
